ABSTRACT

In recent years state governments have taken steps to strengthen their economic bases by promoting growth of high-technology industries within their borders. A byproduct of this effort has been an increasing need for information on the geographic distribution of research and development (R&D) expenditures. The information in this report permits detailed analysis of state- and region-specific R&D activities by industry, academia, nonprofit institutions, and federal agencies. The first section contains highlights and summary information on state and regional R&D concentration levels. Comparisons between the distribution of RaD performance and other socioeconomic variables are included. The second section deals more specifically with R&D performance patterns within each of the nine geographic regions. Appendix A details data sources used in the creation of this report. Data are presented in tabular form for state, region, and performance sector in appendix B. Appendix C consists of personnel and funding profiles for each of the 50 states, the District of Columbia, and the total United States. (CW)

foreword

In recent years, State Governments throughout the country have taken steps to strengthen their economic bases by promoting growth of high-technology industries within their respective borders. A byproduct of this effort has been an increasing need for information on the geographic distribution of research and development (R&D) expenditures. The information in this report permits detailed analysis of State- and region-specific R&D activities by industry, academia, nonprofit institutions, and Federal agencies.

This report complements ongoing data collection efforts by the Division of Science Resources Studies to measure the extent of State support of R&D, as well as other activities within the National Science Foundation (NSF) which encourage interaction with State policymakers. These activities include:

- NSF/State cost sharing in the conduct of research and education as occurs through the Science and Engineering Education programs, the Research Center programs, and the Experimental Program to Stimulate Competitive Research
- NSF's State Initiative, coordinated in the Office of Legislative and Public Affairs, which focuses on strengthening communication with State officials to pursue mutual goals and to stress the link between the science and engineering enterprise and State economic development

William L. Stewart
Director, Division of Science Resources Studies
Directorate for Scientific, Technological,
and International Affairs

background

During the 1980s, States have initiated numerous science and technology (S/T) programs in an effort to foster economic growth and hightechnology development. An important component of many such programs is to fund or otherwise encourage in-State research and development (R&D) activity. To do so, States—which have long looked to the academic sector for such R&D performance—are now paying increasing attention to the R&D activities of industry and not-for-profit organizations, academia-industry R&D linkages, and Federal R&D programs, such as the Superconducting Super Collider. This increase in State S/T initiatives has

created a need to gain a national perspective on State-specific R&D activities.2 This report is directed to meet

(NSF) collects and maintains data on the resources devoted to R&D in the United States, including:

- the level of R&D expenditures,
- the sources of such funds.
- the sector or organization performing the R&D, and

The National Science Foundation

Broad comparative data overviews have been published by Ameritrust/SRI, Indicators of Leonomic Capacity (Cleveland, Ohio, December 1986), and the Corporation for Enterprise Development, Making the Grade The 1988 Development Report Card for the State (Washington, D.C., April 1988). Regionally based interest is exemplified by reports of the Southern Growth Policies Board and the Southern Technology Council, Science & Technology Trends in the South, 1989, and the Institute for Illinois/Council of Great Lakes Governors, Science and Technology in Mid-America (Washington, D.C., 1989). Data tabulation initiatives at the State level include Donald A. Hicks, Innovation and Tomorrow's Economy. The Wisdom of Strategic Investments in a Regional Science and Lech nology Research Base, Regional Research and Technology Program of the North Texas Commission (Dallas/Fort Worth, Texas, October 1 38), and State of Ohio, Office of the Governor Executive Order 89.7 "Creating the Governor's Commission to Set Forth the Ohio Science and Technology Strategic

Plan " (Columbus, Ohio, 1989)

• the character of work undertaken (i.e., whether it is basic research, applied research, or development).

Although these national estimates provide a rich source of information for researchers and policymakers, one constraint on analysis is the general absence of composite geographic R&D performance data. By piecing together existing—although somewhat disparate—NSF data bases, this report should help to fill that gap.

geographic r&d data sources

NSF collects geographic data on R&D expenditures for the individual sectors of the economy. These data which cover varying time periods generally are reported for the institutions performing the R&D rather than for those funding such activities. In this report, we have derived

See, for example, k. Guild Nichols, Technology & Growth State Initiative in Technological Innovation, Final Report of the Task Lorce on Technological Innovation of the National Governors' Association (Washington, D.C., October 1983), Marianne K Clarke, Revitalizing State Economies, A Review of State Economic Development Policies and Programs, National Governors' Association (Washington, D.C., 1986), and Beverly Jones, State Technology Programs in the United States, Governor's Office of Science and Technology, Minnesota Department of Trade and Loo nomic Development (St. Paul, Minn., July 1988)

statewide R&D expenditure totals by summing the sector components reported by the Federal Government, industry, and academia, and those estimated for nonprofit institutions. Because 1985 is the most recent year for which industry geographic R&D data are available, the analysis generally is based on that year. Although NSF is now collecting data from the State Governments on Statefunded and -performed R&D, similar data are not available for the period covered here.

In 1985, more than \$107 billion was spent on R&D activities in the United States. Industrial R&D performance-including that of industrially run federally funded research and development centers (FFRDCs)—reached \$78 billion. These data are estimated from a sample survey of about 1,300 companies. Federal agency obligations (\$13 billion in fiscal year (FY) 1985) are used to estimate Federal intramural R&D performance. The university sector, including activities of university-administered FFRDCs, conducted \$13 billion in R&D in 1985: State-specific R&D data are available for these FFRDCs and doctorategranting institutions only, which accounted for 99 percent of sector total. R&D conducted by other nonprofit institutions and related FFRDCs reached an estimated \$3 billion in 1985. Only Tederal budget obligations to this sector, which totaled \$2 billion in FY 1985, are available, however, on a by-State basis.³

outline of report

The remainder of this report is divided into two sections and three appendixes.

The first section contains highlights and summary information on State and regional R&D concentration levels, including 1975–85 trends, sectoral performance, and the relative importance of Federal R&D funding. It also details comparisons between the distribution of R&D performance and other socioeconomic variables.

The second section deals more specifically with the R&D performance patterns within each of the 9 geographic regions, particularly emphasizing the 10 States in which more

than \$3.5 billion of R&D (or 90 percent of total U.S. R&D) was conducted in 1985.

Appendix A provides a detailed description of the NSF data sources used for this report.

Appendix B is a set of tables on the R&D funding totals for each State, region, and R&D-performing sector. Included, for example, are:

- industry-specific information for the industrial sector,
- field-specific totals for the academic sector, and
- a breakdown of R&D funding and performance by Federal agency.

Appendix C consists of personnel and funding profiles for each of the 50 States, Washington, D.C., and the total United States. Included, for example, are:

- number of scientists and engineers,
- science and engineering graduate enrollment,
- population and labor force,
- R&D performance by sector,
- Federal R&D obligations by agency, and
- gross State product (GSP) and personal income.

See appendix A for a more complete discussion of the data sources used in this report

highlights

regional distribution of r&d expenditures

The United States spent about \$107 billion on R&D activities in 1985. R&D undertaken in the Pacific region (including Alaska, California, Hawaii, Oregon, and Washington) accounted for 24 percent of the national total (chart 1). This figure is considerably higher than the R&D accounted for in each of the other eight geographic regions.

The second largest R&D-performing region in the United States was the Middle Atlantic, which consists of New Jersey, New York, and Pennsylvania. These three States collectively accounted for 18 percent of the R&D performed nationwide. R&D performance in the Great Lakes region (Illinois, Indiana, Michigan, Ohio, and Wisconsin) was third highest nationally (16 percent of total), and was followed by the 13-per-

cent share reported for performers in the eight South Atlantic States and Washington, D.C. The smallest R&D-performing region was the Southeast: Alabama, Kentucky, Mississippi, and Tennessee collectively accounted for only 2 percent of the U.S. total.

r&d concentration within regions

Although the Pacific region led the Nation in terms of total dollars spent, its R&D performance took place mostly in California, 87 percent of the region's R&D total was conted there In contrast, R&D performance in the industrial centers of the Great Lakes was considerably less concentrated. Michigan performed 38 percent of the regional total, lllinois and Ohio each conducted about 20 percent, and Indiana and Wisconsin performed the rest (table 1). Each of the three Mid Atlantic States was among the Nation's leaders in terms of total R&D performance, although New York alone accounted for 43 percent of the region's R&D effort in 1985.

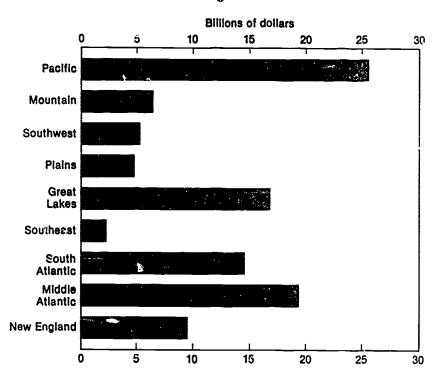

Among the six remaining regions, R&D performance generally is highly concentrated in just a few States. For example:

- Massachusetts accounted for 63 percent of the R&D expenditures in the six New England States (9 percent of the U.S. total),
- Texas accounted for almost 84 percent of the R&D expenditures in the four Southwest States (5 percent of the U.S. total),
- Minnesota accounted for about half of the R&D expenditures in the seven Plains States (4 percent of the U.S. total), and
- Maryland accounted for one-third of the R&D expenditures in the South Atlantic region (eight States and the District of Columbia); this was 14 percent of the U.S. total.

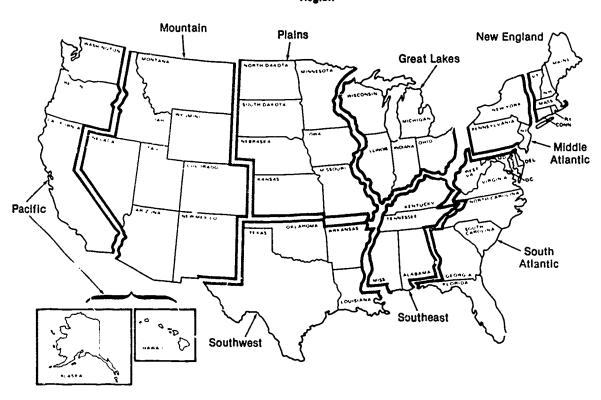

Even in the Southeast (2 percent of U.S. total), where R&D spending was uniformly low in each of the region's four States, 43 percent of the regional total was performed in Alabama alone.

regional r&d growth: 1975–85

Regional R&D performance growth has varied considerably since the midseventies. Between 1975 and 1985, the eight Mountain States recorded the regional high of 8.1percent average annual growth, adjusted for inflation (chart 2). Most of this R&D growth resulted from major spending increases in Department of Energy's (DOE's) FFRDC and defense-related activities. The Southwest also experienced substantial R&D growth (7.3 percent annually), although the neighboring Southeast region had the slowest growth rate (3.5 percent) during this 10-year period. The largest R&D-

performing regions, Pacific and New England, were in the middle range in terms of R&D growth rates. The two regions experienced real annual growth of 6.3 percent and 5.8 percent, respectively. Nationally, real R&D expenditures grew at a 5-percent rate during the 1975–85 period.

In spite of the varying rates of R&D growth over this period, there was no change in the regional rankings. The largest R&D-performing regions in 1975 were the largest such performers in 1985. The smallest R&D regions in 1975 were still the smallest in 1985. In terms of their percentage shares of the national R&D total, however, the Pacific region snowed the largest gain and the Great Lakes States showed the largest relative declines (table B-12).

Chart 2. Average annual R&D performance by region: 1975-85 [Based on 1982 real dollars]

demographic and economic comparisons

The geographic distribution of R&D performance differs somewhat from that of several of the more frequently cited socioeconomic indicators, such as population, income, GSP and manufacturers' shipments. Regional shares of R&D performance, however, follow distribution patterns of Federal R&D obligations and employed Ph.D. scientists and engineers (table 2).4

Coastal regions, particularly in the Northeast (New England and the Middle Atlantic) and West (Mountain and Pacific), account for disproportionately more R&D than is indicated by their shares of national income, output, population, or labor force. For example, New England's share of the R&D total (9 percent) is about one-third greater than its share of the other national totals (between 5 percent and 7 percent each). In contrast, the R&D percentage shares accounted for by the Southern regions (particularly the Southeast and Southwest, but also the South Atlantic) and two Central regions (Great Lakes and Plains) generally fall below their percentage shares of these other socioeconomic variables. Perhaps the most notable example of such disparities is provided by the four Southwestern States. Although they collectively accounted for between 10 percent and 12 percent of the Nation's population, income, manufacturing output, and GSP, relatively little R&Donly 5 percent of the U.S. totalwas performed there.

⁴Zero-order correlations, using data from the 50 States and the District of Columbia, tend to confirm these observations (see last row, table 2). It is to be expected that R&D performance is highly correlated with Federal R&D funding (0.923) and doctoral S⁻¹ employment (0.937). The Lederal Govern⁻¹ at was the source of about half the U.S. R&D in 1985. Further, one-third of all employed doctoral scientists and engineers reported R&D as their primary work activity for mpared, for example, to 27 percent who listed $\cos \alpha = 2$

Table 2. Comparison of R&D performance with other demographic and economic variables: 1985

state distribution of r&d expenditures⁵

State distribution of R&D performance is rather highly concentrated (chart 3). Five States (Cal-

*Unless otherwise indicated, information on State rankings and sectoral performance is based on R&D expenditures that are distributed by State. The percentage share calculations exclude undistributed R&D expenditures, which equal 3 percent of the national total. See appendix A for a description of the undistributed totals.

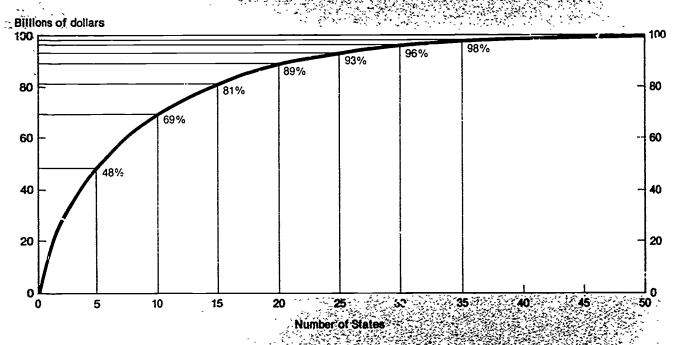

ifornia, New York, New Jersey, Michigan, and Massachusetts) accounted for half the U.S. R&D total, and 10 States (adding Maryland, Texas, Pennsylvania, Illinois, and Ohio) accounted for two-thirds of the total. California's R&D performance reached \$22 billion in 1985; total R&D ranged between \$3 billion and \$9 billion in each of the other nine leading States. Performers in each of the next 11 States and the District of Columbia (table B-2) spent more than \$1 billion and—combined with the first 10 States—collectively accounted for 90 percent of the Nation's R&D. In contrast, only 8 percent of the U.S. R&D effort was performed in the next 13 States; performers in the remaining 16 States accounted for a total estimated 2-percent share. Consequently, the smallest 30 States collectively accounted for only 10 percent (roughly \$10 billion) of the R&D conducted nationwide.

The R&D distribution patterns of the top 10 States have remained rather stable over time. Each of the States ranked among the top 10 in 1985 also were among the top 10 R&D States in 1975. As a percentage of the U.S R&D total, these 10 increased their share from 64 percent to 66 percent over this period. The largest relative gains were reported for Texas (moving from 10th to 7th) and New Jersey (from 5th to 3rd) (chart 4). The R&D undertaken in Pennsylvania showed the largest relative decline among these 10 leaders—its rank gropped from fourth in 1975 to eighth in 1985.

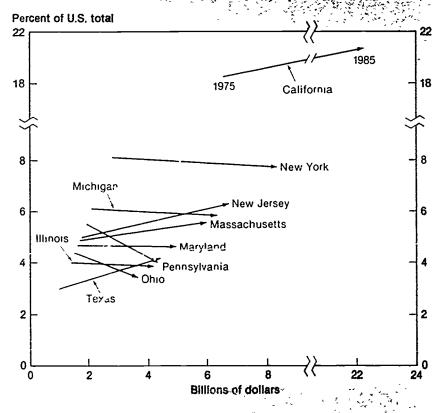

1.

Chart 3. Cumulative distribution of R&D performance by State: 1985

Chart 4. States with largest R&D performance: 1975 and 1965

SOURCE; National Science Foundation, SRS; table 6-12

state concentration in r&d-performing sectors

Within individual sectors, academia's R&D performance is somewhat more dispersed geographically than are industrial and Federal R&D spending-but no by much. Twenty-1 ve States accounted for 90 rercent of the total R&D performed by the academic sector in 1985, compared to the 20 and 17 States that accounted for 90 percent of industrial and Federal &D, respectively. The 10 largest States in terms of academic R&D performance accounted for 67 percent of the \$13 billion spent in 1985. Comparable shares for top 10 Federal and industrial performers were 80 percent and 73 percent.6

Not coincidentally, most of the States that are national leaders in total R&D performance also are leading R&D performers in one or more individual sectors of the economy (table 3). For example, of the 10 States that lead in total R&D performance, all but Maryland were ranked among the top 10 industrial performers and all but Ohio were ranked among the top 10 academic performers. While State rankings are somewhat more mixed in the Federal and nonprofit sectors, each of the 10 leaders in total R&D is ranked among the upper half of R&D performers in both of these two sectors. State R&D performance rankings thus are, in general, strikingly similar across all sectors.

The broader distribution of academic R&D : n part because academia tends to perform researchmore than 90 percent of total—rather than development By companson. Federal and industrial performers focus on development efforts—60 percent and 75 percent, respectively, of their R&D totals Because development activities are likely to require large-scale operations concentrated in fewer locations, R&D dispersion thus might be somewhat more attainable for the academic sector than it is for the Federal Government or industry

^{&#}x27;Rankings based on Federal R&D obligations to nonprofit institutions

NOTE Because data for industrial R&D performnace were suppressed for some States, total and industrial sector rankings must be grouped to avoid disclosure. See appendix 4, Technical Notes.

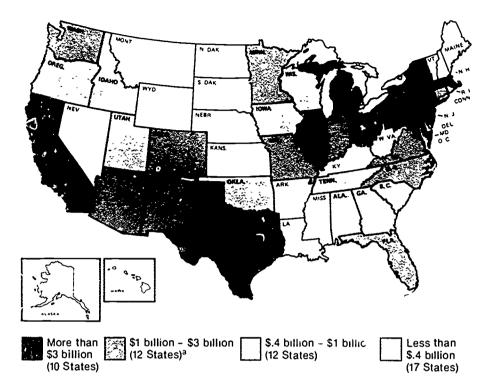

SOURCE National Science Foundation, SRS

ratio of r&d performance to gsp

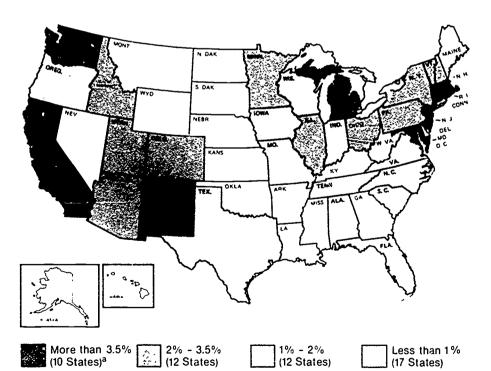

Because the above rankings are based on absolute levels of expenditures, they do not take into account such factors as States' size or economic "health." One way to adjust for such non R&D-related differences is to divide R&D expenditures by data on GSP.⁷ The resulting picture of by-State R&D concentration is somewhat different (chart 5).

Of the 10 largest States in terms of absolute R&D performance, only 5 also were ranked among the top 10 in terms of their R&D/GSP ratios (Maryland, Massachusetts, New Jersey, California, and Michigan). The largest R&D/GSP ratios were achieved by New Mexico (11 percent) and Delaware (8 percent).8 These two States were ranked about 11th and 25th, respectively, in terms of total in-State R&D performance. Washington, Connecticut, and the District of Columbia also were among the R&D/GSP top 10, although they were not so highly ranked in terms of absolute R&D spending. California and New York, on the other hand, were the top two performers in terms of R&D dollars spent, but were only 7th and 17th, respectively, in terms of their R&D/GSP ratios.

Chart 5. Size of total R&D performance by State: 1985

Ratio of total R&D performance to Gross State Product by State: 1985

^aIncludes the District of Columbia
SOURCES National Science Foundation, SRS, table 8.3, Bureau of Economic Analysis

[&]quot;GSP data were published recently by the Bureau of Economic Analysis, U.S. Department of Commerce See V. Renshaw, I. Frott, Jr. and H. Friedenberg, "Gross State Product by Industry, 1963-86," Survey of Current Business, Vol. 68, No. 5 (Washington, D.C., May 1988)

[&]quot;Actually, these ratios are based on the midpoints of the R&D performance ranges in table B.1. The full R&D/GSP range for New Mexico is 10 6 percent to 11.9 percent, for Delaware 19.15.7.6 percent to 8.6 percent. At either end of their respective ranges, these two States remain first and second in terms of R&D/GSP rankings.

In contrast to the position shifting experienced by States with high and middle rankings, the very smallest States in terms of R&D performance (the bottom 15) also were ranked among those with the lowest R&D/GSP ratios (i.e., less than I percent). These States have uniformly low R&D expenditure and economic output levels.

Nationwide, R&D spending was equivalent to 2.7 percent of gross national product (GNP) in 1985. Performance in 13 States and the District of Columbia exceeded this ratio, whereas the R&D/GSP ratio of 37 States fell below the national mean (table B-3). The median ratio was about 1.5 percent—25 States above and 25 States below.

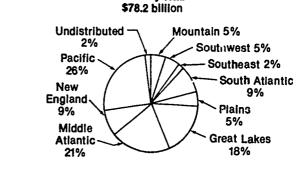

geographic distribution of r&d spending by sector

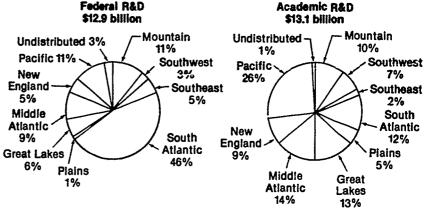

industry

Of the four sectors of the economy for which detailed R&D data are available-industry, Federal Government, universities and colleges, and other nonprofit institutions industry accounted for the largest share of R&D performance in each of the nine geographic regions (table B-4). Nationally, industry accounted for 73 percent of the R&D total. Its share of regional performance totals ranged from 47 percent in the South Atlantic States to 84 percent in the Great Lakes States. The Pacific region, however, accounted for the largest regional share (26 percent, or \$20 billion) of industry's national R&D effort (\$78 billion) (chart 6).

Chart 6. Distribution of sectoral R&D performance by region: 1985

Industry R&D

SOURCE: National Science Foundation, SRS; tables 8-1 and 8-4

Aircraft and missiles companies performed the bulk—23 percent—of the Nation's industrial R&D effort (table B-8), and was the largest industrial R&D performer in 11 States (table B-7)

federal government

Almost halt the Federal Government's intramural R&D performance (\$12.9 billion) was undertaken in the South Atlantic region (especially the District of Columbia and its neighboring States, Maryland and Virginia). Government's

performance accounted for a regionleading 41-percent share of the South Atlantic's R&D total. In contrast, the Federal Government performed only 4 percent of the R&D conducted in both the Great Lakes and Plains regions. Nationwide, Federal agencies performed 12 percent of the R&D total: the Department of Defense (DOD) accounted for 64 percent of the Federal R&D performance effort in 1985 (table B-6). The Department of Health and Hi an Services (HHS) and the National Aeronautics and Space Administration (NASA) each accounted for about 9 percent of total, and the Department of Agriculture (USDA) performed 5 percent of the Federal R&D

academia

As a percentage of the academic sector's total R&D effort (\$13.1 billion, including FFRDCs), the Pacific region again led all others, accounting for 26 percent (\$3.4 billion) of total. Academia, however, accounted for a region-leading 21-percentage-point share of R&D in the eight Mountain States—\$1.4 billion.

Much of this sector's regional importance is due to the large role FFRDCs play in the total academic R&D effort. FFRDC: accounted for 51 percent and 57 percent, respectively, of academia's 1985 R&D effort in the Pacific and Mountain regions.

Academia's relative contribution to total R&D was lowest---9.7 percent—in the Middle Atlantic region, where the sector's performance reached almost \$1.9 billion in 1985. In all other regions of the country, the academic sector accounted for between 10 percent and 16 percent of total R&D activity. Nationwide, academia's share of the country's R&D total was 12 percent.

nonprofit institutions

Based on available geographic nonprofit data (that is, Federal obligations to this sector), the New England States—specifically Massachusetts—led all others by a large margin in terms of the nonprofit regional R&D share. The nonprofit sector accounted for 8.9 percent of New England's R&D performance compared to a 2-percent share or less in each of the other eight regions.

sectoral distribution by state

The relative importance of the various sectors differs somewhat between States with large R&D activity and those where little R&D is conducted. Generally, in terms of performance shares, academia is the most important sector in States with small overall R&D performance levels. Industry R&D, on the other hand, accounts for a relatively larger share of total in States where substantial R&D activity is undertaken by all sectors.

Chart 7 illustrates the point. The sector shares for South Dakota, the State with the smallest amount of R&D performance, are plotted on the left-hand vertical axis. About 40 percent of South Dakota's R&D is performed by the academic sector: the remainder is almost evenly split between industry and the Federal Government. Moving across the chart, larger by-State R&D performances are sequentially summed, with the plotting along the right-land axis

showing distribution shares for total U.S. R&D performance. Industry share of total is 74 percent; the Federal Government and academia account for 11 percent and 12 percent, respectively, and the nonprofit sector for 2 percent.¹⁰

Although relative sector shares fluctuate somewhat, within the smaller States' R&D performance subtotals, academia is by far the most important sector, followed by Federal intramural performers, and then the industrial sector.¹¹ (The non-profit sector generally accounts for between 1 percent and 3 percent of all R&D performance subtotals.) Only after the smallest 12 States are summed does industry's share of the

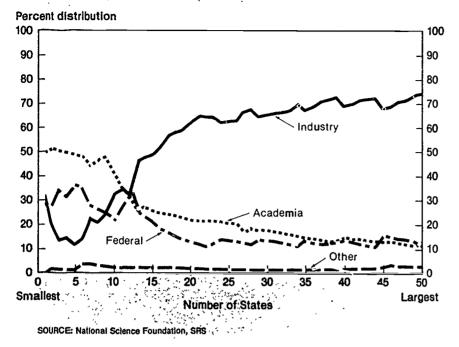

⁹See appendix A for further details on data available for the nonprofit sector

These calculations do not include either R&D expenditures for the District of Columbia or those that could not be geographically distributed (see appendix A). While the undistributed portion is a relatively small part of the U.S. R&D total—2.8 percent—its importance vanes considerably within each of the individual sectors. For example, undistributed industry tunds account for most (49.6 percent, or \$1.4 billion) of all undistributed funds, but equals only 1.8 percent of the \$78.2 billion spent by industry in 1985. By companson, undistributed funds accounted for 3.3 percent (\$0.4 billion) of the Federal Government's, 1.4 percent of academia's (\$0.2 billion), and an estimated 31.0 percent of the nonprofit sector's (\$1.0 billion) R&D performance (table B-4)

[&]quot;Universities and colleges in Hawaii accounted for 65 percent of all R&D performed in the State. In only six other States (Alaska, Arkansas, Nebraska, North Dakota, South Dakota, and Wyoming) did the academic sector account for more than 40 percent of the R&D total. Each of these seven States ranked among the 15 smallest in terms of total by-State R&D performance.

Chart 7. Distribution of cumulative R&D performance by sector: 1985

R&D total reach those of government and academia Each of the three sectors account for about one-third of the R&D performed.

Thereafter, relative shares of both government and academia decrease, while that of industry increases. The summed R&D performance shares of the 25 smallest States are 64 percent for industry, 20 percent for academia, and 14 percent for the Federal Government. Adding in the R&D performance in the 25 largest States, changes in sector distribution subtotals are more subtle. Generally, industry accounts for about 70 percent of R&D

performance subtotals, the Federal Government's share fluctuates in a 12-percent to 16-percent range, and academically performed R&D declines steadily from 20 percent to about 12 percent of total

distribution of federal r&d obligations

The Federal Government provided approximately half the R&D

funds spent nationwide in 1985. Although the State distribution shares of Federal R&D funds and total R&D performance do not match exactly, the two do tend to go hand-in-hand (tables 2 and B-5). States that account for a large share of the Nation's R&D performance generally receive a large share of the Federal Government's R&D support.

DOD is the primary source of Federal R&D funds in 33 States and the District of Columbia and the secondary Federal source in 7 States. It provided 63 percent of all Federal R&D funds in 1985. Industry—especially electrical equipment and aircraft and missiles firms—is the major recipient of defense-related R&D support. The academic sector, however, also has received considerable DOD funding for research in such fields as engineering and mathematics and computer sciences.

Overall, HHS is the second largest Fe leral funder of R&D (mostly biomedical), comprising 12 percent of the Federal total. HHS is the primary funder in 5 States and the secondary funder in 24 others. Other primary Federal R&D funding agencies are DOE (in seven States, three of which are in the Mountain region), USDA (in Montana, Nebraska, and North Dakota, States with large rural economies), and the Interior (in two States-South Dakota and mineral-rich Alaska). DOE accounted for 11 percent of the 1985 Federal total, USDA for 2 percent, and the Interior for less than 1 percent. NASA provided 7 percent of all Federal R&D funds, but was not the primary Federal source of funds in any individual State

2.

characteristics of regional r&d performance

The scope and scale of its R&D activity is unique to each of the nine geographic regions. For example, the performance shares of the different sectors vary extensively from one region to another (chart 8). Industry's R&D role is most pronounced in the Great Lakes; academic R&D has its largest regional share in the Mountain States (however, if academically administered FFRDCs are excluded, academia's relative R&D share is largest in the Southwest); the Federal Government's performance is greatest-both in absolute and percentage terms—in the South Atlantic region; and nonprofit R&D performance is highest in New England.

At a more disaggregated level, the differences in regional R&D

performance are even more striking. For example, although industry accounts for the largest share of the R&D total in each region, the major product lines of the R&D-performing companies differ considerably among States. Academic research fields also differ by region, as does the role of various Federal agencies in terms both of funding research and conducting intramural R&D.

new england

The six New England States accounted for 8.9 percent (\$9.5 billion) of the U.S 1985 R&D total. Four regions performed more R&D; four performed less. Most (about 63 percent) of New England's R&D was

undertaken in Massachusetts. This State was ranked fifth nationally in terms of total and industrial R&D, third in academic R&D, and first in Federal R&D obligations to the non-profit sector. Connecticut accounted for 24 percent of the region's R&D total, the region's four other States performed 13 percent of total.

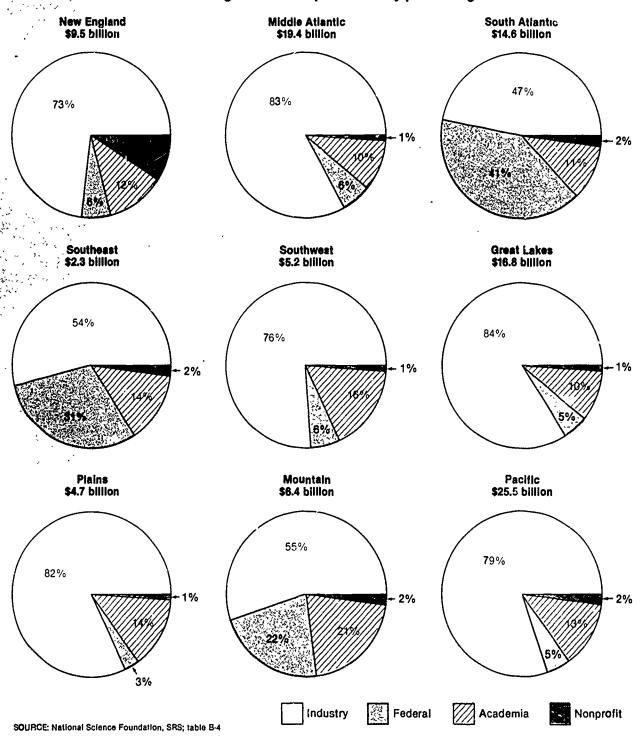

New England's industrial R&D performance share was about average for the Nation as a whole—72.6 percent versus 72.8 percent. The region's three top R&D-performing industries were electrical equipment (especially the communications segment in Massachusetts), computers, and aircraft and missiles (especially in Connecticut) (tables B-7 and B-8). Two-thirds of the region's industrial R&D was company-funded, one-

15

 \mathcal{Z}_{ω}

Chart 8. Distribution of regional R&D expanditures by performing sector: 1985

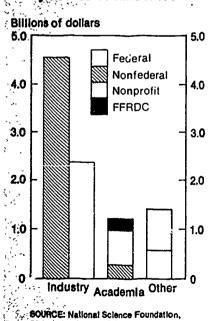

third of the funds came from Federal sources (chart 9). Most of these Federal R&D dollars were spent by companies in the electrical equipment industry—many of which were small, high-tech companies established over the last decade along Massachusetts' famed Route 128 corridor.

DOD was the leading Federal intramural performer in the region (table B-6): Almost half of its regional activities were undertaken in Rhode Island. DOD and HHS were the top two Federal sources of R&D funds in each of the six States (table B-5).

The academic sector performed 12 percent of New England's R&D total; the Massachusetts-based, DOD-sponsored FFRDC, Lincoln Laboratory, accounted for one-quarter of this. Most (80 percent) of the region's academic R&D funds was provided by the Federal Government HHS provided almost half the R&D funds used by academic performers other than FFRDCs. Of the non-Federal sources of academic R&D, industry provided 28 percent of New England's total; this was more

Chart 9. R&D performance in the New England region by source of funds: 1985

SRS; tables B1 and B9

than industry's relative contribution in any other region (table B-11). State and local governments provided only 6 percent of the non-Federal total. this was the lowest nationwide.

Academic R&D was concentrated in the life sciences (35 percent) and the various engineering disciplines (29 percent) (table B-10). Only in the Pacific region did the academic sector spend more on engineering R&D than was similarly spent in New England.

Fourteen percent of Massachusetts' total R&D performance was in the nonprofit sector. (Most was undertaken in the primarily DOD-funded Draper Laboratories.) Given this large proportion, the nonprofit sector accounted for 9 percent of New England's R&D total. The Massachusetts nonprofit sector received more Federal R&D funds—of which 60 percert was from DOD and 35 percent from HHS—than did this sector in any other State.

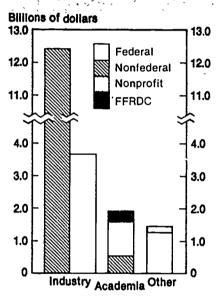

middle atlantic

Each of the three Mid-Atlantic States was ranked among the top eight in terms of total R&D in both 1975 and 1985. New York was ranked second in both years, and New Jersey moved from fifth to third. Pennsylvania, on the other hand, dropped from fourth to eighth largely as a rested of slow industrial R&D growth. Overall, the region was second only to the Pacific States in terms of total R&D performance in 1985: Eighteen percent (\$19.4 billion) of the U.S. total was conducted in the Mid-Atlantic

Industry accounted for 83 percent of the regional R&D effort. This was nearly identical to industry's leading 84-percent share in the Great Lakes. In terms of by-State industrial R&D activity, New York, New Jersey, and Pennsylvania were ranked second, fourth, and sixth, respectively, in 1985. In New York, the machinery (especially computers) and electrical equipment (especially communica-

tion) industries were largest, with each reporting R&D performance of more than \$1.5 billion. The electrical equipment industry also was the largest R&D-performing industry in both New Jersey and Pennsylvania. Moreover, the chemicals (in both New York and New Jersey) and instruments (New York) industries each expended more than \$1 billion on R&D. About one-third of the region's total industrial R&D funds came from Federal sources (chart 10) and were received largely by firms developing computer and communications systems for the military.

Chart 10. R&D performance in the Middle Atlantic region by source of funds: 1985

SOURCE: National Science Foundation, SRS; tables B-1 and B-9

Federal agencies performed 6 percent of the R&D undertaken in the region, and DOD accounted for 88 percent of this total. This was the highest Federal agency performance share in any of the nine regions.

Academia performed 10 percent of the Mid-Atlantic R&D total. Almost half of this was in the life sciences; 29 percent was in the physical

sciences. Federal agencies funded 72 percent of the academic R&D activities. Excluding FFRDCs, which received most of their funding from DOE, HHS provided 56 percent of the region's academic Federal R&D total. Only the Pacific region received more Federal funds for academic R&D; only the South Atlantic and Great Lakes regions received more non-Federal academic R&D funding (table B-9). New York was the 2nd largest academic performer in the Nation (14 percent of the State's R&D was performed by this sector), Pennsylvania was 8th largest, and New Jersey was 10th nationally.

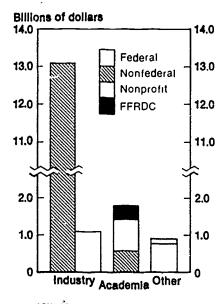

great lakes

No other region saw its share of the R&D total fall as much as did the Great Lakes between 1975 and 1985. Within the five Great Lakes States. R&D performance fell from 17.0 percent to 15.6 percent (\$16.8 billion) of the Nation's total during this period. While most of the relative decline resulted from slow growth in Ohio-which fell from 7th to 10th nationally-by-State R&D also fell as a percentage of the national total in Michigan (moving from 3rd to 4th), Illinois (9th each year), and Wisconsin (between 23rd and 26th in both years). R&D growth in Indiana was about even with the national growth rate-11.8 percent per year or a 5percent annual increase in real terms. Just as these States' R&D growth rates have not differed substantially from one another, the R&D undertaken in the region also is fairly well distributed: Three States were ranked among the top 10 in 1985 and the other two also placed above the national median.

Industry accounted for a regionleading 84-percent share of total. Michigan, Illinois, and Ohio each was ranked among the top nine industrial performers in the country. In fact, the industrial sector was relatively more important in Michigan than in any other State except Delaware, accounting for 94 percent of Michigan's R&D total. Most (80 percent) of the State's R&D expenditures were provided by motor vehicle companies. Conversely, two-thirds of the R&D performed nationwide by this industry (\$7.1 billion in 1985) took place in Michigan. Companies in the electrical equipment, chemicals, and rubber products industries performed more than \$500 million in R&D in Ohio; the largest industrial R&D performers in Illinois were electrical equipment (especially communication) and machinery companies. Almost all-92 percent—of the region's 1985 industrial R&D performance was funded by companies. The Federal Govern-'ed little industry R&D ment pr support (c 1rt 11).

The academic sector accounted for 10 percent of the regional R&D total and—excluding that performed at the DOE-sponsored Argonne National Laboratory in Illinois—was distributed rather evenly among the States. Forty percent of the region's

Chart 11. R&D performance in the Great Lakes region by source of funds: 1985

SOURCE: National Science Foundation, SRS; tables B-1 and B-9

academic R&D was in the life sciences and about one-fourth was in the physical sciences. HHS provided half the Federal funds for academic R&D (excluding Argonne). Institutional sources accounted for 49 percent of academia's non-Federal funding, only 14 percent came from industry.

Federa' and nonprofit performers together comprised only 5 percent of the Great Lakes' R&D total DOD was the largest Federal R&D performer, most of its work took place in Ohio.

plains

The seven Plains States collectively accounted for 4.4 percent (\$4.7 billion) of the 1985 national R&D performance total. They held a 3.8-percent share in 1975. The region's largest performers, Minnesota and Missouri, ranked 15th and 19th nationally in 1985. Four of the region's States—Kansas, Nebraska, and the Dakotas—placed among the smallest third in terms of total R&D performance.

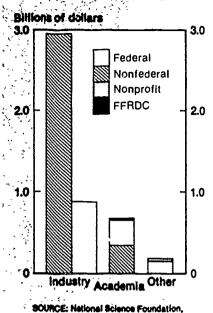

Most (82 percent) of the R&D in the Plains was performed by industry; the largest performers were computer, aircraft and missiles, and chemical companies. Companies funded 77 percent of the region's industrial R&D; the Federal Government funded the rest (chart 12).

The importance of the industrial sector to the R&D effort in the Plains States varies considerably. Companies accounted for most of the R&D undertaken in Minnesota (89 percent of total) and Missouri (85 percent), but for much less in the largely rural States of Nebraska (36 percent), South Dakota (31 percent), and North Dakota (18 percent) (table B-4).

Universities and colleges accounted for a region-leading 14-percent share and for about one-third or more of the R&D in four of the Plains States (North Dakota, Nebraska, South Dakota, and lowa). The dollar amount of academic R&D was

Chart 12. R&D performance in the Plains region by source of funds: 1985

SRS; tables 8-1 and B-9

south atlantic

Total R&D activities in the South Atlantic equaled \$14.6 billion, or 13.6 percent of the 1985 U.S. total. This is roughly the same share of total it held in 1975. Maryland was the region's largest R&D performer; it rose from seventh to sixth in terms of total R&D during this period. The region's largest relative gains, however, were made by South Carolina which moved from about 40th in 1975 to 31st in 1985.

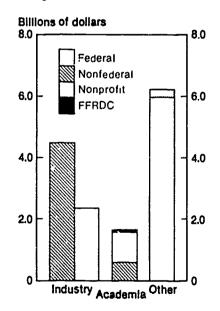

Nonacademic R&D in the region's eight States and the District of Columbia was rather evenly split between industry and the Federal Government (chart 13). Industry's R&D share (47 percent) was smaller in the South Atlantic than in the other eight regions, even though this sector comprised about 95 percent of Delaware's total R&D—the national high in 1985.

quite small, however, and was concentrated in the life sciences (68 percent of the \$0.7 billion academic R&D total). HHS pro ded 63 percent of the Federal funds for academic R&D; this explains (in part) the high concentration in the life sciences. As a share of academic total, the HHS contribution was more than in the other eight regions.

Fully half of academic R&D was funded by non-Federal sources. This made the Plains one of only two regions (the Southwest was the other) where non-Federal academic R&D funding was larger than Federal funding. Nationwide, Federal funds account for 73 percent of the academic—including university-administered FFRDCs—R&D effort (table B-9).

Federal intramural performance equaled only 3 percent of the region's R&D effort: USDA was responsible for half of this, which was undertaken primarily in Iowa.

Chart 13. R&D performance in the South Atlantic region by source of funds: 1985

SOURCE: National Science Foundation, SRS; tables B-1 and B-9

Aircraft and missiles and chemical companies accounted for most of the industrial R&D effort, and was performed primarily in Florida (which ranked 13th in total industrial performance in 1985), Maryland (ranked 14th), and Delaware (ranked 19th). Maryland and Virginia also have a large number of telecommunications, computer software, and electronics firms performing R&D for the Government. 12 Most companies performing R&D in North Carolina (ranked about 22nd nationally) are located in the Research Thangle Park, which is the largest planned research park in the United States.

Federal intramural performance accounted for 41 percent (\$6 billion) of the region's R&D total and was performed mostly by DOD, HHS, and NASA. In no other region did Federal performance or share of total reach nearly as high. Almost half the Federal Government's total intramural performance took place in the South Atlantic, especially Marvland, the District of Columbia, and Virginia. Indeed, the Federal R&D effort is the primary reason why Marvland is ranked sixth in terms of to al R&D: It accounted for 60 percent (\$3 billion) of the State's 1985 R&D total. A large share of this regional effort, however, included Federal R&D administrative activities in addition to laboratory research.

The academic sector accounted for 11 percent of the regional performance total and, as in many other regions, was concentrated in the life sciences. Academic research in the math and computer sciences was also well represented in this region: 14 percent of the Nation's math computer science R&D was unctaken here—second only to the Pacific region. The Federal Government funded two-thirds of the academic R&D in the South Atlantic, of which 52 percent came from HHS. Of the

National Science Foundation: Geographic Distribution of Industrial Re-D Performance, Special Report, NY 88-317 (Washington, D.C., 1988)

non-Federal academic R&D support, 52 percent was provided from universities' own funds, compared with a 46-percent share nationwide.

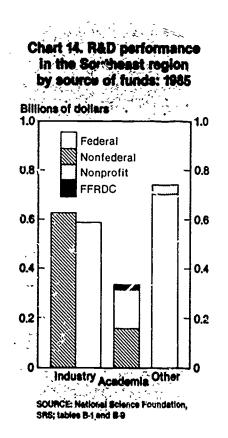

southeast

The four Southeart States accounted for the smallest share of the Nation's regional R&D total in 1985—2.1 percent, or \$2.3 billion. Moreover, this was down slightly from a 2.4-percent share in 1975. Alabama, the Southeast's largest 1985 performer, ranked just 23rd nationally in terms of total R&D. Half the Southeast's R&D effort was performed by industry, one-third by the Federal Government, and the rest by academia and other nonprofit institutions.

The Southeast region performed less than 2 percent of the Nation's industrial R&D total. Tennessee accounted for the largest industrial R&D performance, but was ranked only 24th nationally in this sector. The larg 3: R&D-performing industry in both Tennessee and Alabama was aircraft and missiles. In Alebama, much of the industry R&D has been related to the Strategic Defense Initiative. Not surprisingly, given industry's defense focus, the Federal Government provided 51 percent of the funds used in the region's industrial R&D activities (chart 14) The Federal share of industry's R&D regional effort was second largest in the Nation after the Pacific region, where Federal funds accounted for 60 percent of the industrial total.

DOD and NASA were the largest Federal intramural performers in the Southeast (63 percent and 25 percent of the 1985 sector total, respectively). Most of NASA's regional R&D activities were performed in Alabama, and DOD accounted for one-third of all k&D performed in Mississippi.

Only 54 percent of the R&D performed in the Southeast's universi-

Industry accounted for 76 percent of the region's R&D otal, two-thirds of which was funded out of companies' own funds (chart 15). Most (87 percent) of the Southwest's industrial R&D was undertaken in Texas. Leading the State's industrial performers were petroleum refining, primary metals, electrical equipment, and aircraft and missiles companies: Each reported R&D eftorts of between \$500 million and \$900 million in 1985. Petroleum refining companies were also among the largest industrial R&D performers in Oklahoma and Louisiana.

The Federal Government accounted for 12 percent of the region's R&D total. The largest Federal performer—half of total—was NASA's work in Texas.

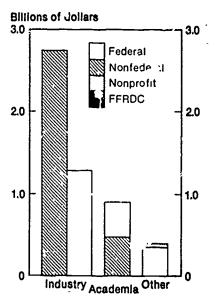

Academia performed 16 percent of the region's R&D. Although the sector's R&D performance in Texas far outdistanced that of its neighboring States in dollar terms, academia was most important in

ties and colleges was federally funded—compared with 73 percent nationally, the remaining 46 percent came from non-Federal sources. HHS and USDA were the largest Federal funding agencies, State and local governments provided the largest share (37 percent) of the non-Federal total (table B-11). Of the academic R&D total, 75 percent went to the life sciences in 1985.

southwest

During the 1975–85 decade, the four Southwest States increased from a 3.9-percent share of U.S. R&D funding to 4.9 percent (\$5.2 billion). All of this increase is due to R&D growth in Texas, which moved from 10th to 7th in terms of total R&D performance, and—in 1935—accounted for 84 percent of all R&D undertaken in the region.

Chart 15. R&D performance in the Southwest region by source of funde: 1985

SOURCE: National Science Foundation, SPS; tables B-1 and B-9

Arkansas and Louisiana as a share of State total. About 40 percent of all R&D in these two States was performed by universities and colleges.

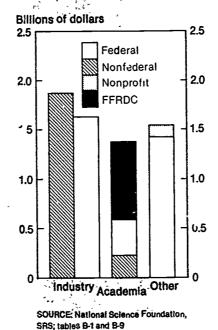

The Southwest is the only region in which non-Federal sources accounted for a larger share of the academic R&D total than did Federal sources—53 percent versus 47 percent. It is also the only region in which there was no academically administered FFRDC R&D activity. The universities themselves and State and local governments were the source of most non-Federal funds (43 percent and 25 percent of total); HHS provided 58 percent of the Federal funding to academic R&D.

mountain

The eight Mountain States accounted for 5.9 percent (\$6 4 billion) of the national R&D total in 1985. This was about 30 percent greater than its 1975 share, making R&D growth in the Mountain region greater than in any other region during this 10-year period. Growth was most rapid in Idaho, New Mexico, Arizona, and Colorado.

The academic sector accounted for one-fifth of the regional R&D activity, a figure which led the Nation in terms of this sector's share of regional performance levels. Over half (57 percent) the region's academic total was R&D performed in university-administered FFRDCs (chart 16) located in New Mexico, Arizona, and Colorado. DOE sponsored 82 percent of this research; New Mexico's Los Alamos Scientific Laboratory performed 90 percent or the region's academic FFRDC R&D total (table B-10). Over one-quarter of the academic R&D effort was provided separately to universities and colleges by Federal agencies. Non-Federal sources funded only 17 percent of the academic effort. Industry provided 21 percent of the non-Federal total-the second largest share in the

Chart 16, R&D performance in the Mountain region by source of funds: 1985

Nation. R&D in the physical sciences accounted for 33 percent of the academic total, engineering for 25 percent, and the life sciences for 21 percent.

Industry accounted for 55 percent of the regionally performed R&D; industry's share of the R&D total was smaller only in the Southeast and South Atlantic regions. Machinery companies in Arizona and Colorado and electrical equipment companies in New Mexico were the largest industry performers in the Mountain States.

Federal intramural performance was 22 percent of the region's R&D total—this was second only to its 41-percent share of total in the South Atlantic region. DOD activities predominated in the Mountain States, representing 85 percent of this sector's total, and occurring primarily in New Mexico.

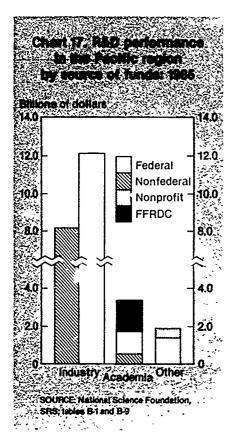

pacific

As a result of the R&D undertaken in California, the Pacific region led all others in terms of total, industrial, and academic R&D expenditures. The region accounted for 23.7 percent (\$25.5 billion) of the R&D performed nationwide, and California accounted for 87 percent of the regional effort (20.7 percent of the U.S. total). In 1975, the Pacific region accounted for 21.1 percent of the national R&D total, and California alone for 18.6 percent. Washington's share of the Nation's R&D total also grew from 1.8 percent to 2.4 percent between 1975 and 1985.

Industry performed almost 80 percent of the Pacific States' R&D; DOD was the most important source of revenues for such activities. By far, most of the region's R&D was performed by California's aircraft and missiles industry. It accounted for 56 percent (\$10 billion) of the State's industrial R&D expenditures. Aircraft and missiles firms were also the largest R&D performers in Washington and Hawaii.13 The electrical equipment industry (\$1.9 billion), especially including electronic components, was the second largest industrial R&D performer in California. Many of these high R&D-performing companies are located in San Francisco's Silicon Valley. Primarily because of the defense-related nature of the aircraft and missiles and electrical equipment industries, 60 percent of the region's industrial R&D total was funded by the Federal Government (chart 17).

The aircraft and missiles industry is historically the largest performer of industrial R&D nationwide. For a full discussion of R&D expenditures by type of industry, see National Science Foundation. Science and Technology Resources in American Industry, NST 88-321 (Washington D.C., in press).

The Pacific was the only region in which Federal funds to industry exceeded that of industry's own funding. Although California is the leading recipient (\$10 billion) of Federal funds for industrial R&D performance (\$27 billion provided nationwide), industries in Washington and Hawaii also had more Federal than companies' own R&D expenditures in 1985.

Academia performed 13 percent (\$3.36 billion) of the Pacific region's R&D. Most of this (\$1.73 billion) was performed by four California FFRDCs which were funded primarily by DOE and NASA. Federally funded non-FFRDC performance accounted for another 34 percent (\$1.15 billion) of academia's total-of which 46 percent came from HHS and 18 percent from DOD. Of the region's non-Federal academic R&D funds (only 15 percent of sector total), industry provided just 7 percent. Its percentage contribution was lowest of the nine regions. In dollar terms, industry's academic R&D funding of

Pacific universities and colleges was only slightly more than for Southeast and Plains institutions.

In terms of the region's total academic R&D performance, the five Pacific States accounted for one-third or more of the national effort in the math and computer sciences, engineering, and the environmental sciences. No other region's academic R&D performance levels were nearly as high. Academia accounted for one-quarter or better of the R&D performed in Hawaii, Alaska, and Oregon.

Although in dollar terms, Federal intramural R&D performance was higher only in the South Atlantic and Mountain regions, it accounted for just 5 percent of the Pacific region's total R&D effort. Of the Federal regional performance, DOD activities in California accounted for 73 p.r-cent. In the other four Pacific States, but primarily Washington, Federal spending by all agencies—especially NASA—accounted for the rest.

industry

The National Science Foundation (NSF) sponsors an annual survey of industrial research and development (R&D) which has been conducted by the U.S. Bureau of the Census for about 30 years. A sample of approximately 13,000 companies was drawn in 1981; estimates of total 1985 industrial R&D expenditures were derived from this sample. About 1,800 companies in the sample—those firms with R&D expenditures exceeding \$1 million—received a survey form each year between 1981 and 1986. Data for the remaining companies are estimated until the next sample is drawn. According to the survey instructions, industry reporting is limited to R&D in the physical sciences, including related engineering, and the biological sciences, which includes medicine but not psychology. Market research activities are specifically excluded from the R&D survey definition.

In odd-numbered years, survey respondents are asked to report the dollar amounts of R&D performed within each State that the company has R&D laboratories or facilities. Up to 10 percent of a company's R&D total may be reported as "not distributed by State." Because of this provision, in 1985—the most recent year for which these data are available—\$1.4 billion (1.8 percent) of industry's national \$78.2 billion total was not broken out by State. In this report, such funds also are left undistributed rather than allocated to individual States.

Another difficulty is that, to avoid disclosing individual company operations, the Census Bureau ppresses certain data on industrial R&D expenditures which it collects for NSF. In 1985, data were withheld for nine States and the District of Columbia. The suppressed amount equaled \$2.2 billion, or 2.8 percent of the Nation's industrial R&D performance in that year.

Although it withholds data for some individual States, the Census Bureau includes performance estimates of companies located in such States in the appropriate regional totals. For example, 1985 industrial R&D performance was estimated at \$6.92 billion in the six New England States. Specific amounts equaling \$6.64 billion were reported separately for Connecticut, New Hampshire, Massachusetts, and Rhode Island; this left the remaining \$281 million to be jointly accounted for by the region's other two States (Maine and Vermont).

This report provides ranges within which the Census-reported industrial performance data fall. The high and low ends of the State ranges were obtained from information recently made available in an NSF industry report.³ While the industry report does not disclose information suppressed by the Census Bureau, it does provide by-State details on total industrial R&D (see appendix table 1 of that report), company-funded R&D (appendix table 3), and the rank

¹National Science Foundation Research and Development in Industry, 1984, Detailed Statistical Iables (Washington, D.C., 1985)

In tour of these States, the Census Bureau released information on company-funded R&D even though the total and tederally runded amounts were withheld. This information is used to provide lower bounds on industrial R&D performance ranges.

National Science Foundation, Geographic Distribution of Industrial Research and Development, Special Report. NSI-88-317 (Washington, D.C., 1988)

of the 20 States with the largest industrial R&D expenditures (table 2). The industry report also contains a chart which groups each State by one of five industrial performance categories:

- more than \$2 billion,
- between \$1 billion and \$2 billion,
- between \$0.5 billion and \$1 billion.
- between \$75-\$500 million, and
- less than \$75 million.

These data are used to derive the industrial performance ranges in the present report.

federal government

Geographic data for Federal intramural R&D performance are budget obligations as reported by the 10 major R&D-supporting agencies.4 Obligations in this report are for the fiscal year (FY) ending September 30, 1985. These amounts are for orders placed, contracts awarded, services received, and similar transactions during FY 1985 regardless of when funds were appropriated and when future payment of money is required. Consequently, obligation data differ from outlays since these latter represent the amounts for checks issued and cash payments made during a given period, regardless of when the funds were appropriated. Intramural government R&D activities cover costs associated vith the planning and administration of intramural and extramural R&D programs by Federal personnel as well as actual intramural R&D performance.

In FY 1985, \$426 million—or 3 percent of 'he reported \$12.9 billion intrami al total—could not be

⁴National Science Foundation, Tederal Funds for Research and Development Tiscal Years 1985, 1986, and 1987, Volume XXXV, Detailed Statistical Tables (Washington, D.C., 1985) distributed among the individual States. This R&D was performed by agencies other than the top 10, for which detailed State data are reported.

academia

This sector consists of all institutions of higher education, both public and private, as well as those federally funded research and development centers (FFRDCs) administered by universities and colleges or their consortia. Regional R&D performance totals are available for all universities and colleges combined (\$9.52 billion in FY 1985); however, State-specific R&D expenditures data are available only for institutions that grant doctorates in science and engineering (\$9.38 billion, or 98.5 percent c' the universities' and colleges' 1. 1985 total). The difference between these two figures was left undistributed throughout this report: No attempt was made to allocate such R&D to the individual States. Because of the small dollar amounts involved, the omission from any one State's performance total should be minimal.

University-administered FFRDCs performed \$3.53 billion worth of R&D in 1985. The amounts were assigned to the States where the FFRDCs are located (that is, where the R&D is performed). These are not necessarily the same States in which the administering institutions have their campuses.

nonprofit sector

NSF does not collect geographic R&D performance data for nonprofit institutions outside the academic sector. Therefore, to proxy the performance of these institutions, this report uses FY 1985 Federal R&D obligations, by State, to nonprofit institutions and FFRDCs administered by nonprofit institutions. Consequently, the State and regional data

for this sector are reported by source rather than by performer, exclude all non-Federal sources of funds, and result in a large undistributed component.

In FY 1985, the nonprofit sector's total R&D performance was an estimated \$3.3 billion,⁵ of which Federal obligations accounted for \$2.2 billion. This leaves approximately \$1.1 billion of this sector's R&D performance not distributed by State.

In general, zero figures indicated for individual States represent FY 1985 Federal R&D obligations of less than \$0.5 million. Only in South Dakota were there no reported Federal R&D obligations to nonprofit institutions.

r&d performance in 1975

Table B-12 in this report contains 1975 R&D performance data and 1975–85 growth rates for the United States, each of the 9 regions, and 37 States. These data generally were compiled in the same way as detailed above for 1985:

- Industry performance is based on the NSF/Census company reported survey.
- Federal performance is FY 1575 obligations.
- Academic performance is for all universities and colleges, not just doctorate-granting institutions, and includes FFRDCs.
- Nonprofit performance is FY 1975 obligations to nonprofit organizations and associated FFRDCs.

Total R&D performance data for 13 States and the District of Columbia are not reported in table B-12. This is because the industrial R&D component is unavailable for either 1975 or 1985.

National Science Loundation, Networal Patterns of R&D Resources 1989, Linal Report, NSI 89-308 (Washington, D.C., 1989)

appendix c

state personnel and funding profiles

The following tables contain summary information on the science and technology resource base in the United States, each of the 50 States, and the District of Columbia. Data on additional demographic and economic variables also are detailed.

The National Science Foundation's Division of Science Resources Studies is the source for the data on science and engineering personnel and on R&D funds.

Other Federal data sources are.

- Bureau of the Census, Department of Commerce;
- Bureau of Economic Analysis (BEA), Department .. Cominerce;
- Bureau of Labor Statistics (BLS) Department of Labor.

Population, Federal expenditures and manufactures' shipments data are from Census; personal income and gross State product data are from BEA; and BLS is the source for labor force data. Federal expenditures include grants, salaries and wages, direct payments to individuals, and procurements which are on an obligation basis.
